Download bdd and cbdd and the step by step of understanding and of them also. Q: What is a property of a small portion of a piecewise function? Given a piecewise-defined function f with n pieces on intervals $[a_1, b_1], \dots, [a_n, b_n]$ respectively:

$$f(x) = \begin{cases} c_1, & \text{\textit{\$x\in [a_1, b_1]\$}} \\ c_2, & \text{\textit{\$x\in [a_2, b_2]\$}} \\ \dots \\ c_n, & \text{\textit{\$x\in [a_n, b_n]\$}} \end{cases}$$

What we can say about the properties of a small portion $[a_1, b_1]$ of the function? What about $[a_2, b_2]$? What is the relationship between this small portion and the whole function? A: You can not say anything about the properties of a part of f . But you can say that the derivative of f vanishes at a point a_k . Without any further assumptions (eg. f is continuous at a_1) the derivative of f at a_1 is $f'(a_1)$. By induction this says that $f'(x)$ is undefined at the points a_k . The converse holds also: If the derivative of f does vanish at a_1 , then f is analytic at a_1 . A typical example of this type of result are $f(x)=0$ where $f'(x)=0$ at a_1 , which is the same as f being analytic at a_1 . the rest of the attributes. :returns: The next definition stage of the operation. :rtype: :class:`oefn.l5d.op_def_stage.OpDefStage` 6d1f23a050
